SahiDana

Sahi dana, har number ka hisaab.

A phone tool that tells a village animal-health worker the cheapest right feed for a cow or buffalo, and shows where every number came from.

THE PROBLEM

Most dairy feeding is done by habit, not by numbers

Too little

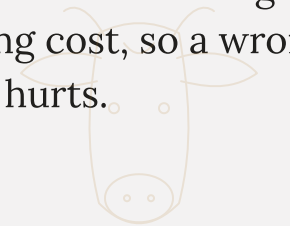

If the feed misses protein, energy or minerals, the animal gives less milk and stays weak.

Too much

Extra grain or cake that the animal does not need is money poured away every single day.

Guesswork

Without a calculator, the mix comes from habit and from what the neighbour feeds. Feed is the largest running cost, so a wrong guess hurts.

THE GAP

Balanced feeding pays, but it needs a trained helper

₹25·5

average gain per animal, per day

₹16.3 lower feed cost plus ₹9.2 more milk and fat. Source: NDDB Ration Balancing Programme, across 33,374 villages.

So why is it not everywhere?

Today the calculation is done by a trained local helper with a laptop, or by closed apps that nobody outside can check. Where neither is at hand, the farmer is left guessing.

OUR IDEA

A feed calculator that works at the cowshed door and shows its working.

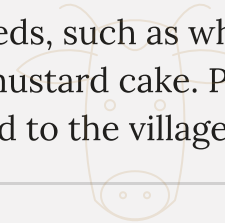

SahiDana finds the cheapest mix of local feeds that still meets what the animal needs, then lets anyone tap a number to see where it came from.

- Works without internet
- Hindi or English
- Open code, checkable

HOW IT WORKS

Three steps, one tap at the end

01	Describe the animal	Cow or buffalo, breed, weight, milk per day and fat. With internet you can also type it in your own words.
02	Pick feeds and prices	Choose from 31 Jaipur feeds, such as wheat straw, green maize and mustard cake. Prices are dated and can be changed to the village rate.
03	Tap Balance ration	Get the kilos of each feed per day, the cost, and the milk it supports.

A REAL RESULT FROM THE LIVE APP

Murrah buffalo, 450 kg, giving 8.8 litres a day

FEED	KG PER DAY	₹ PER DAY
Maize fodder (green)	40.00	100.00
Mustard cake	2.29	75.56
Wheat bran	0.92	18.48
Wheat straw	2.18	13.08
Mineral mixture	0.10	7.00
Common salt	0.05	0.40
Total	**45.54**	**214.51**

₹36.69

less per day than the example's current ration of ₹251.20 (14.6%)

9.6 L

of milk per day supported, against 8.8 L today

From the app's Lactating buffalo demo, 14 Oct 2026. The current ration and prices are the demo's example inputs, not field data.

WHY TRUST IT

The calculator decides. AI only translates.

Maths, not guesses

The amounts come from a solver and published ICAR and NDDB tables. AI only reads the description and explains the answer. It cannot invent a nutrient or a price.

Shows its working

Tap any figure to see its source: the document, table and page, or the rule that set it.

Cross-checked

On 18 test animals our solver agreed 100% with SciPy, an independent scientific solver. 196 automated tests pass.

Honest status: expert sign-off on the source figures is still pending, and the app says so on screen next to each one.

WHERE WE STAND

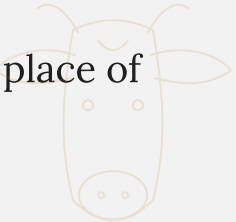

Working today, and what we will finish next

Working today

- Live, installable app that runs offline
- 31 Jaipur feeds and 16 cattle and buffalo breeds, each with a source
- Hindi and English, one language per screen
- Open code on GitHub

Still to do

- Expert check of the feed and requirement figures
- Native-speaker review of the Hindi wording
- Live mandi prices in place of dated estimates

Try it sahidana.vercel.app **Code** github.com/jegadeesh17/ProjectSahiDana
